

MARIJUANA DABS, WAX AND SHATTER : **What You Should Know**

What is Dabbing?

Dabbing is inhaling the vapors from a concentrated form of marijuana made by an extraction method that uses butane gas. Dabs, also known as butane hash oil (BHO) — which are sometimes called "budder," "honeycomb" or "earwax" — are more potent than conventional forms of marijuana because they have much higher concentrations of the chemical THC than is found in regular cannabis.

RISKS AND SIDE EFFECTS

Chronic use of cannabis extracts can cause:

- Passing Out
- Increased heart rate
- Learning impairment
- Dizziness
- Fainting
- Anxiety
- Reduced ability to learn
- Poor balance
- Memory problems
- Vomiting
- Paranoia
- Slurred speech

How Dabbing Works:

Dabs are made by pouring butane over marijuana, which allows THC to leave the plant material and dissolve into the butane. The butane-THC solution is then pressed through a filter and is placed in a dish or tray.

Dabbing generally involves the use of a modified bong or water pipe, also known as a dab rig.

Dabs are vaporized through contact with a hot surface such as a nail or glass rod, which has been heated with a blowtorch, and then inhaled.

Dabs are also used in vapor pens and in e-cigarettes.
